

Exponential Functions - Continued

Exponential Functions - Continued

► We found: that $y = 2^x$ is a function called an exponential function.

Exponential Functions - Continued

► We found: that $y = 2^x$ is a function called an exponential function.

Was there anything special about the base 2 here?

Exponential Functions - Continued

► We found: that $y = 2^x$ is a function called an exponential function.

Was there anything special about the base 2 here?

Can we define other Exponential Functions with different bases?

Exponential Functions - Continued

► We found: that $y = 2^x$ is a function called an exponential function.

Was there anything special about the base 2 here?

Can we define other Exponential Functions with different bases?

The answer to both questions is yes!

Exponential Functions - Continued

► We found: that $y = 2^x$ is a function called an exponential function.

Was there anything special about the base 2 here?

Can we define other Exponential Functions with different bases?

The answer to both questions is yes!

For other bases b , we can define an exponential function: $y = b^x$

Exponential Functions - Continued

► We found: that $y = 2^x$ is a function called an exponential function.

Was there anything special about the base 2 here?

Can we define other Exponential Functions with different bases?

The answer to both questions is yes!

For other bases b , we can define an exponential function: $y = b^x$

So, what special property does 2 have that b needs as well?

Exponential Functions - Continued

► We found: that $y = 2^x$ is a function called an exponential function.

Was there anything special about the base 2 here?

Can we define other Exponential Functions with different bases?

The answer to both questions is yes!

For other bases b , we can define an exponential function: $y = b^x$

So, what special property does 2 have that b needs as well?

► Recall: For certain exponents, like $\frac{1}{2}$, we can only use a base which is positive.

Exponential Functions - Continued

► We found: that $y = 2^x$ is a function called an exponential function.

Was there anything special about the base 2 here?

Can we define other Exponential Functions with different bases?

The answer to both questions is yes!

For other bases b , we can define an exponential function: $y = b^x$

So, what special property does 2 have that b needs as well?

► Recall: For certain exponents, like $\frac{1}{2}$, we can only use a base which is positive.

For example: $4^{1/2} = \sqrt{4} = 2$ is a real number

Exponential Functions - Continued

► We found: that $y = 2^x$ is a function called an exponential function.

Was there anything special about the base 2 here?

Can we define other Exponential Functions with different bases?

The answer to both questions is yes!

For other bases b , we can define an exponential function: $y = b^x$

So, what special property does 2 have that b needs as well?

► Recall: For certain exponents, like $\frac{1}{2}$, we can only use a base which is positive.

For example: $4^{1/2} = \sqrt{4} = 2$ is a real number

But $(-4)^{1/2} = \sqrt{-4} = 2i$ is a complex number

Exponential Functions - Continued
