Reducing Fractions

Reducing Fractions

We found that:

$$\frac{a}{m} \cdot \frac{b}{n} = \frac{a \cdot b}{m \cdot n} \qquad \text{and} \qquad \frac{n}{n} = 1 \text{ for } n \neq 0$$

Reducing Fractions

that:

$$\frac{a}{m} \cdot \frac{b}{n} = \frac{a \cdot b}{m \cdot n} \qquad \text{and} \qquad \frac{n}{n} = 1 \text{ for } n \neq 0$$

Because of this, we can write one number in multiple different ways!

Reducing Fractions

that: $$\frac{a}{m} \cdot \frac{b}{n} = \frac{a \cdot b}{m \cdot n}$$ and $$\frac{n}{n} = 1 \text{ for } n \neq 0$$

Because of this, we can write one number in multiple different ways!

Example:

$$\frac{2}{6} =$$

Reducing Fractions

that: $\qquad \dfrac{a}{m} \cdot \dfrac{b}{n} = \dfrac{a \cdot b}{m \cdot n}$ $\qquad$ and $\qquad \dfrac{n}{n} = 1$ for $n \neq 0$

Because of this, we can write one number in multiple different ways!

Example:

$$\frac{2}{6} = \frac{2 \cdot 1}{2 \cdot 3}$$

Reducing Fractions

that:
$$\frac{a}{m} \cdot \frac{b}{n} = \frac{a \cdot b}{m \cdot n}$$
and
$$\frac{n}{n} = 1 \text{ for } n \neq 0$$

Because of this, we can write one number in multiple different ways!

Example:

$$\frac{2}{6} = \frac{2 \cdot 1}{2 \cdot 3} = \frac{2}{2} \cdot \frac{1}{3}$$

Reducing Fractions

that: $\qquad \dfrac{a}{m} \cdot \dfrac{b}{n} = \dfrac{a \cdot b}{m \cdot n}$ $\qquad$ and $\qquad \dfrac{n}{n} = 1$ for $n \neq 0$

Because of this, we can write one number in multiple different ways!

Example:

$$\frac{2}{6} = \frac{2 \cdot 1}{2 \cdot 3} = \underbrace{\frac{2}{2}}_{1} \cdot \frac{1}{3}$$

Reducing Fractions

that: $\quad \dfrac{a}{m} \cdot \dfrac{b}{n} = \dfrac{a \cdot b}{m \cdot n}$ $\qquad$ and $\qquad$ $\dfrac{n}{n} = 1$ for $n \neq 0$

Because of this, we can write one number in multiple different ways!

Example:

$$\frac{2}{6} = \frac{2 \cdot 1}{2 \cdot 3} = \underbrace{\frac{\cancel{2}}{\cancel{2}}}_{1} \cdot \frac{1}{3} = \frac{1}{3}$$

Reducing Fractions

that:
$$\frac{a}{m} \cdot \frac{b}{n} = \frac{a \cdot b}{m \cdot n} \qquad \text{and} \qquad \frac{n}{n} = 1 \text{ for } n \neq 0$$

Because of this, we can write one number in multiple different ways!

Example:

$$\frac{2}{6} = \frac{2 \cdot 1}{2 \cdot 3} = \underbrace{\frac{2}{2}}_{1} \cdot \frac{1}{3} = \frac{1}{3}$$

So we have that: $\dfrac{2}{6} = \dfrac{1}{3}$

Reducing Fractions

that:
$$\frac{a}{m} \cdot \frac{b}{n} = \frac{a \cdot b}{m \cdot n} \qquad \text{and} \qquad \frac{n}{n} = 1 \text{ for } n \neq 0$$

Because of this, we can write one number in multiple different ways!

Example:
$$\frac{2}{6} = \frac{2 \cdot 1}{2 \cdot 3} = \underbrace{\frac{\cancel{2}}{\cancel{2}}}_{1} \cdot \frac{1}{3} = \frac{1}{3}$$

So we have that: $\frac{2}{6} = \frac{1}{3}$

This process re-writing a fraction with smaller numbers on top and bottom is called *reducing a fraction*

Reducing Fractions

that: $\quad \dfrac{a}{m} \cdot \dfrac{b}{n} = \dfrac{a \cdot b}{m \cdot n} \qquad$ and $\qquad \dfrac{n}{n} = 1$ for $n \neq 0$

Because of this, we can write one number in multiple different ways!

Example:

$$\frac{2}{6} = \frac{2 \cdot 1}{2 \cdot 3} = \underbrace{\frac{\cancel{2}}{\cancel{2}}}_{1} \cdot \frac{1}{3} = \frac{1}{3}$$

So we have that: $\dfrac{2}{6} = \dfrac{1}{3}$

This process re-writing a fraction with smaller numbers on top and bottom is called *reducing a fraction*

Note: To reduce a fraction, there must be a common factor in the top and bottom that can be reduced to 1
