Intro to Graphing Polynomials

Intro to Graphing Polynomials

When graphing lines and quadratics, we used the $x-$ and $y-$intercepts as important reference points in our graphs.

Intro to Graphing Polynomials

When graphing lines and quadratics, we used the $x-$ and $y-$intercepts as important reference points in our graphs.

Similarly, the $x-$ and $y-$int are important in graphing Polynomials.

Intro to Graphing Polynomials

When graphing lines and quadratics, we used the $x-$ and $y-$intercepts as important reference points in our graphs.

Similarly, the $x-$ and $y-$int are important in graphing Polynomials.

Also similar to linear and quadratic functions, it will be easier to find the $y-$intercept than the $x-$intercept.

Intro to Graphing Polynomials

When graphing lines and quadratics, we used the $x-$ and $y-$intercepts as important reference points in our graphs.

Similarly, the $x-$ and $y-$int are important in graphing Polynomials.

Also similar to linear and quadratic functions, it will be easier to find the $y-$intercept than the $x-$intercept.

For a polynomial:

$$P(x) = a_n x^n + a_{n-1} x^{n-1} + \cdots + a_2 x^2 + a_1 x + a_0$$

Intro to Graphing Polynomials

When graphing lines and quadratics, we used the $x-$ and $y-$intercepts as important reference points in our graphs.

Similarly, the $x-$ and $y-$int are important in graphing Polynomials.

Also similar to linear and quadratic functions, it will be easier to find the $y-$intercept than the $x-$intercept.

For a polynomial:

$$P(x) = a_n x^n + a_{n-1} x^{n-1} + \cdots + a_2 x^2 + a_1 x + a_0$$

We can find the $y-$ intercept by finding the point when $x = 0$

Intro to Graphing Polynomials

When graphing lines and quadratics, we used the $x-$ and $y-$intercepts as important reference points in our graphs.

Similarly, the $x-$ and $y-$int are important in graphing Polynomials.

Also similar to linear and quadratic functions, it will be easier to find the $y-$intercept than the $x-$intercept.

For a polynomial:

$$P(x) = a_n x^n + a_{n-1} x^{n-1} + \cdots + a_2 x^2 + a_1 x + a_0$$

We can find the $y-$ intercept by finding the point when $x = 0$

$$P(0) = a_n \cdot 0^n + a_{n-1} \cdot 0^{n-1} + \cdots + a_2 \cdot 0^2 + a_1 \cdot 0 + a_o$$

Intro to Graphing Polynomials

When graphing lines and quadratics, we used the $x-$ and $y-$intercepts as important reference points in our graphs.

Similarly, the $x-$ and $y-$int are important in graphing Polynomials.

Also similar to linear and quadratic functions, it will be easier to find the $y-$intercept than the $x-$intercept.

For a polynomial:

$$P(x) = a_n x^n + a_{n-1} x^{n-1} + \cdots + a_2 x^2 + a_1 x + a_0$$

We can find the $y-$ intercept by finding the point when $x = 0$

$$P(0) = a_n \cdot 0^n + a_{n-1} \cdot 0^{n-1} + \cdots + a_2 \cdot 0^2 + a_1 \cdot 0 + a_o = a_o$$

Intro to Graphing Polynomials

When graphing lines and quadratics, we used the $x-$ and $y-$intercepts as important reference points in our graphs.

Similarly, the $x-$ and $y-$int are important in graphing Polynomials.

Also similar to linear and quadratic functions, it will be easier to find the $y-$intercept than the $x-$intercept.

For a polynomial:

$$P(x) = a_n x^n + a_{n-1} x^{n-1} + \cdots + a_2 x^2 + a_1 x + a_0$$

We can find the $y-$ intercept by finding the point when $x = 0$

$$P(0) = a_n \cdot 0^n + a_{n-1} \cdot 0^{n-1} + \cdots + a_2 \cdot 0^2 + a_1 \cdot 0 + a_o = a_o$$

So, for any polynomial, the $y-$intercept is: $(0, a_0)$

Intro to Graphing Polynomials

When graphing lines and quadratics, we used the $x-$ and $y-$intercepts as important reference points in our graphs.

Similarly, the $x-$ and $y-$int are important in graphing Polynomials.

Also similar to linear and quadratic functions, it will be easier to find the $y-$intercept than the $x-$intercept.

For a polynomial:

$$P(x) = a_n x^n + a_{n-1} x^{n-1} + \cdots + a_2 x^2 + a_1 x + a_0$$

We can find the $y-$ intercept by finding the point when $x = 0$

$$P(0) = a_n \cdot 0^n + a_{n-1} \cdot 0^{n-1} + \cdots + a_2 \cdot 0^2 + a_1 \cdot 0 + a_o = a_o$$

So, for any polynomial, the $y-$intercept is: $(0, a_0)$

What about the $x-$intercepts?

Intro to Graphing Polynomials

When graphing lines and quadratics, we used the $x-$ and $y-$intercepts as important reference points in our graphs.

Similarly, the $x-$ and $y-$int are important in graphing Polynomials.

Also similar to linear and quadratic functions, it will be easier to find the $y-$intercept than the $x-$intercept.

For a polynomial:

$$P(x) = a_n x^n + a_{n-1} x^{n-1} + \cdots + a_2 x^2 + a_1 x + a_0$$

We can find the $y-$ ▸ intercept by finding the point when $x = 0$

$$P(0) = a_n \cdot 0^n + a_{n-1} \cdot 0^{n-1} + \cdots + a_2 \cdot 0^2 + a_1 \cdot 0 + a_o = a_o$$

So, for any polynomial, the $y-$intercept is: $(0, a_0)$

What about the $x-$intercepts? $y = 0$

Intro to Graphing Polynomials

When graphing lines and quadratics, we used the $x-$ and $y-$intercepts as important reference points in our graphs.

Similarly, the $x-$ and $y-$int are important in graphing Polynomials.

Also similar to linear and quadratic functions, it will be easier to find the $y-$intercept than the $x-$intercept.

For a polynomial:

$$P(x) = a_n x^n + a_{n-1} x^{n-1} + \cdots + a_2 x^2 + a_1 x + a_0$$

We can find the $y-$ intercept by finding the point when $x = 0$

$$P(0) = a_n \cdot 0^n + a_{n-1} \cdot 0^{n-1} + \cdots + a_2 \cdot 0^2 + a_1 \cdot 0 + a_o = a_o$$

So, for any polynomial, the $y-$intercept is: $(0, a_0)$

What about the $x-$intercepts? $y = 0$

So, to find the $x-$intercepts we need to solve:

Intro to Graphing Polynomials

When graphing lines and quadratics, we used the $x-$ and $y-$intercepts as important reference points in our graphs.

Similarly, the $x-$ and $y-$int are important in graphing Polynomials.

Also similar to linear and quadratic functions, it will be easier to find the $y-$intercept than the $x-$intercept.

For a polynomial:

$$P(x) = a_n x^n + a_{n-1}x^{n-1} + \cdots + a_2 x^2 + a_1 x + a_0$$

We can find the $y-$ intercept by finding the point when $x = 0$

$$P(0) = a_n \cdot 0^n + a_{n-1} \cdot 0^{n-1} + \cdots + a_2 \cdot 0^2 + a_1 \cdot 0 + a_o = a_o$$

So, for any polynomial, the $y-$intercept is: $(0, a_0)$

What about the $x-$intercepts? $y = 0$

So, to find the $x-$intercepts we need to solve:

$$0 = a_n x^n + a_{n-1}x^{n-1} + \cdots + a_2 x^2 + a_1 x + a_0$$

Intro to Graphing Polynomials

When graphing lines and quadratics, we used the $x-$ and $y-$intercepts as important reference points in our graphs.

Similarly, the $x-$ and $y-$int are important in graphing Polynomials.

Also similar to linear and quadratic functions, it will be easier to find the $y-$intercept than the $x-$intercept.

For a polynomial:

There is no perfect way to solve this.

Our best method is to find the roots is with the Rational Root Theorem

Once we find the roots $x = k_1, k_2, k_3, \ldots$ then the $x-$intercepts are:

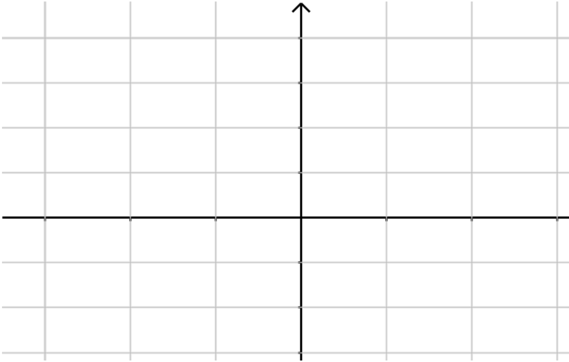
$$(k_1, 0), (k_2, 0), (k_3, 0), \cdots$$

Intro to Graphing Polynomials

Intro to Graphing Polynomials

Suppose that we find **all** of the $x-$ and $y-$intercepts are:

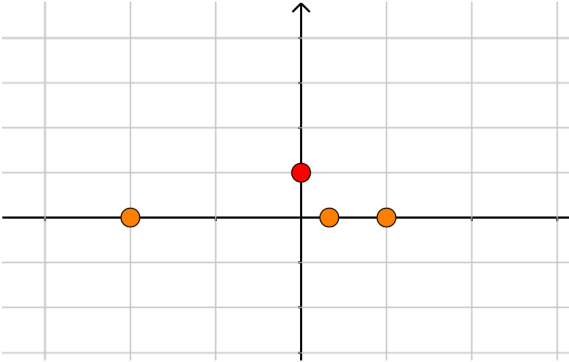
$x-$int: $(k_1, 0), (k_2, 0), (k_3, 0)$ and $y-$int: $(0, a_o)$



Intro to Graphing Polynomials

Suppose that we find **all** of the $x-$ and $y-$intercepts are:

$x-$int: $(k_1, 0), (k_2, 0), (k_3, 0)$ and $y-$int: $(0, a_o)$

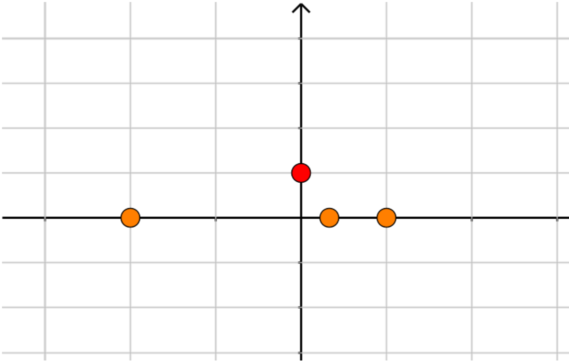


Intro to Graphing Polynomials

Suppose that we find **all** of the $x-$ and $y-$intercepts are:

$x-$int: $(k_1, 0), (k_2, 0), (k_3, 0)$ and $y-$int: $(0, a_o)$

What does the graph look like between the intercepts?



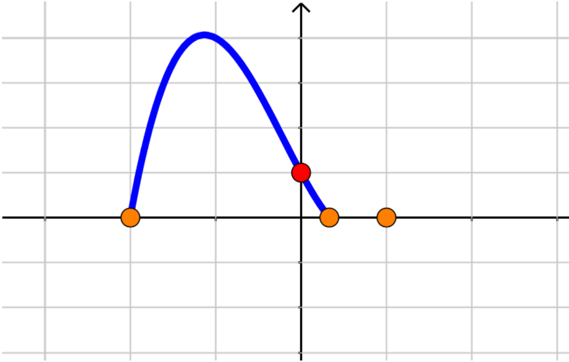
Intro to Graphing Polynomials

Suppose that we find **all** of the $x-$ and $y-$intercepts are:

$x-$int: $(k_1, 0), (k_2, 0), (k_3, 0)$ and $y-$int: $(0, a_o)$

What does the graph look like between the intercepts?

We might not know exactly what the graph looks like.



Intro to Graphing Polynomials

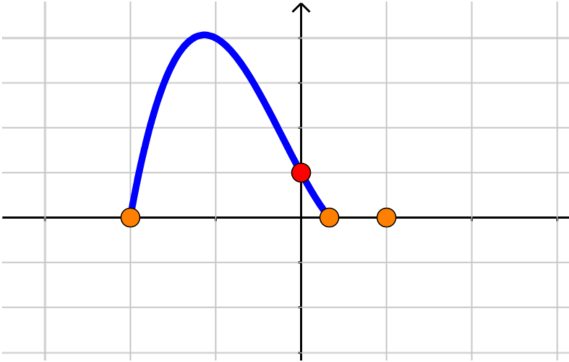
Suppose that we find **all** of the $x-$ and $y-$intercepts are:

$x-$int: $(k_1, 0), (k_2, 0), (k_3, 0)$ and $y-$int: $(0, a_o)$

What does the graph look like between the intercepts?

We might not know exactly what the graph looks like.

The graph does not change from pos. to neg. (or vice-versa).



Intro to Graphing Polynomials

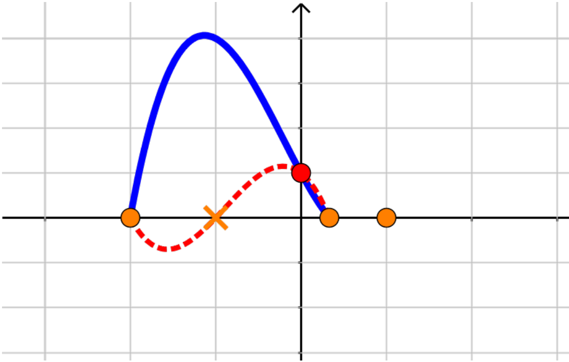
Suppose that we find **all** of the $x-$ and $y-$intercepts are:

$x-$int: $(k_1, 0), (k_2, 0), (k_3, 0)$ and $y-$int: $(0, a_o)$

What does the graph look like between the intercepts?

We might not know exactly what the graph looks like.

The graph does not change from pos. to neg. (or vice-versa). Why not?



Intro to Graphing Polynomials

Suppose that we find **all** of the $x-$ and $y-$intercepts are:

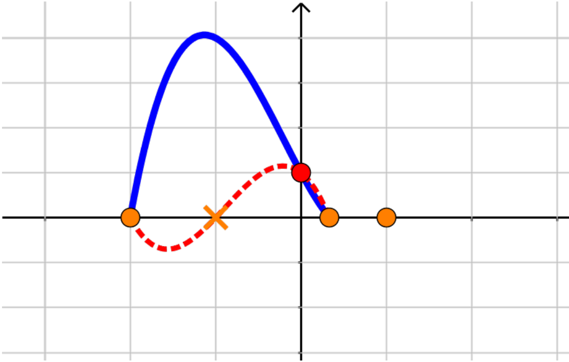
$x-$int: $(k_1, 0), (k_2, 0), (k_3, 0)$ and $y-$int: $(0, a_o)$

What does the graph look like between the intercepts?

We might not know exactly what the graph looks like.

The graph does not change from pos. to neg. (or vice-versa). Why not?

Because then there would need to be another $x-$intercept between them



Intro to Graphing Polynomials

Suppose that we find **all** of the $x-$ and $y-$intercepts are:

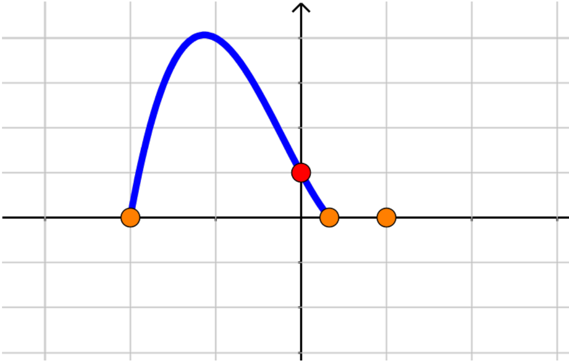
$x-$int: $(k_1, 0), (k_2, 0), (k_3, 0)$ and $y-$int: $(0, a_o)$

What does the graph look like between the intercepts?

We might not know exactly what the graph looks like.

The graph does not change from pos. to neg. (or vice-versa). Why not?

Because then there would need to be another $x-$intercept between them



Intro to Graphing Polynomials

Suppose that we find **all** of the $x-$ and $y-$intercepts are:

$x-$int: $(k_1, 0), (k_2, 0), (k_3, 0)$ and $y-$int: $(0, a_o)$

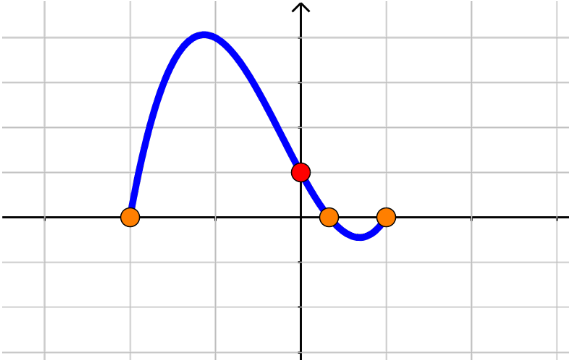
What does the graph look like between the intercepts?

We might not know exactly what the graph looks like.

The graph does not change from pos. to neg. (or vice-versa). Why not?

Because then there would need to be another $x-$intercept between them

This is the same between each pair of $x-$intercepts



Intro to Graphing Polynomials

Suppose that we find **all** of the $x-$ and $y-$intercepts are:

$x-$int: $(k_1, 0), (k_2, 0), (k_3, 0)$ and $y-$int: $(0, a_o)$

What does the graph look like between the intercepts?

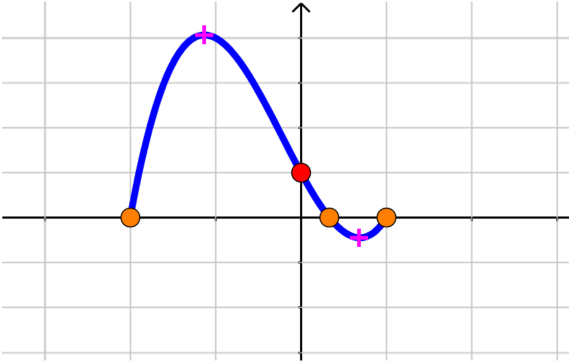
We might not know exactly what the graph looks like.

The graph does not change from pos. to neg. (or vice-versa). Why not?

Because then there would need to be another $x-$intercept between them

This is the same between each pair of $x-$intercepts

Notice: For our graph to connect the $x-$int there are *Turning Points*



Intro to Graphing Polynomials

Suppose that we find **all** of the $x-$ and $y-$intercepts are:

$x-$int: $(k_1, 0), (k_2, 0), (k_3, 0)$ and $y-$int: $(0, a_o)$

What does the graph look like between the intercepts?

We might not know exactly what the graph looks like.

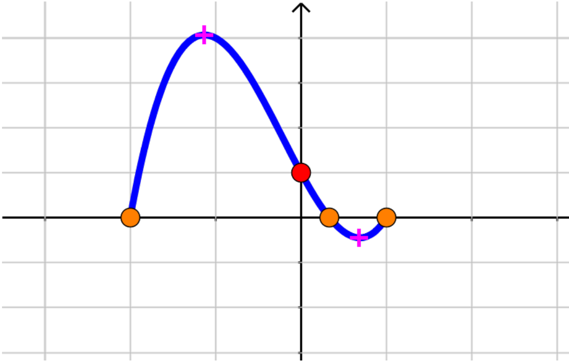
The graph does not change from pos. to neg. (or vice-versa). Why not?

Because then there would need to be another $x-$intercept between them

This is the same between each pair of $x-$intercepts

Notice: For our graph to connect the $x-$int there are *Turning Points*

We will need to wait until Calculus to pinpoint the coords of *Turning Points*



Intro to Graphing Polynomials

Suppose that we find **all** of the $x-$ and $y-$intercepts are:

$x-$int: $(k_1, 0), (k_2, 0), (k_3, 0)$ and $y-$int: $(0, a_o)$

What does the graph look like between the intercepts?
