## Introduction to Polynomials

So far, the two functions that we explored most deeply are:

# Introduction to Polynomials

So far, the two functions that we explored most deeply are:

Linear functions:

$$y = f(x) = mx + b$$

## Introduction to Polynomials

So far, the two functions that we explored most deeply are:

Linear functions:

$$y = f(x) = mx + b$$

Quadratic functions:

$$y = f(x) = ax^2 + bx + c$$

## Introduction to Polynomials

So far, the two functions that we explored most deeply are:

Linear functions:

$$y = f(x) = mx + b$$

Quadratic functions:

$$y = f(x) = ax^2 + bx + c$$

Notice the similarity between these.

## Introduction to Polynomials

So far, the two functions that we explored most deeply are:

Linear functions:

$$y = f(x) = mx + b$$

Quadratic functions:

$$y = f(x) = ax^2 + bx + c$$

Notice the similarity between these.

Although it might not be obvious at first glance, in both of them we are adding up powers of  $x$

## Introduction to Polynomials

So far, the two functions that we explored most deeply are:

Linear functions:

$$y = f(x) = mx^1 + bx^0$$

Quadratic functions:

$$y = f(x) = ax^2 + bx^1 + cx^0$$

Notice the similarity between these.

Although it might not be obvious at first glance, in both of them we are adding up powers of  $x$

## Introduction to Polynomials

So far, the two functions that we explored most deeply are:

Linear functions:

$$y = f(x) = mx^1 + bx^0$$

Quadratic functions:

$$y = f(x) = ax^2 + bx^1 + cx^0$$

Notice the similarity between these.

Although it might not be obvious at first glance, in both of them we are adding up powers of  $x$

The jump from linear to quadratic meant we included  $x^2$

## Introduction to Polynomials

So far, the two functions that we explored most deeply are:

Linear functions:

$$y = f(x) = mx^1 + bx^0$$

Quadratic functions:

$$y = f(x) = ax^2 + bx^1 + cx^0$$

Notice the similarity between these.

Although it might not be obvious at first glance, in both of them we are adding up powers of  $x$

The jump from linear to quadratic meant we included  $x^2$

So, the next logical step is to see what happens if we include  $x^3$

## Introduction to Polynomials

So far, the two functions that we explored most deeply are:

Linear functions:

$$y = f(x) = mx^1 + bx^0$$

Quadratic functions:

$$y = f(x) = ax^2 + bx^1 + cx^0$$

Notice the similarity between these.

Although it might not be obvious at first glance, in both of them we are adding up powers of  $x$

The jump from linear to quadratic meant we included  $x^2$

So, the next logical step is to see what happens if we include  $x^3$

But then we'll need to include  $x^4$

## Introduction to Polynomials

So far, the two functions that we explored most deeply are:

Linear functions:

$$y = f(x) = mx^1 + bx^0$$

Quadratic functions:

$$y = f(x) = ax^2 + bx^1 + cx^0$$

Notice the similarity between these.

Although it might not be obvious at first glance, in both of them we are adding up powers of  $x$

The jump from linear to quadratic meant we included  $x^2$

So, the next logical step is to see what happens if we include  $x^3$

But then we'll need to include  $x^4$

And after that  $x^5$ ,  $x^6$ , etc.

## Introduction to Polynomials

So far, the two functions that we explored most deeply are:

Linear functions:

$$y = f(x) = mx^1 + bx^0$$

Quadratic functions:

$$y = f(x) = ax^2 + bx^1 + cx^0$$

Notice the similarity between these.

Although it might not be obvious at first glance, in both of them we are adding up powers of  $x$

The jump from linear to quadratic meant we included  $x^2$

So, the next logical step is to see what happens if we include  $x^3$

But then we'll need to include  $x^4$

And after that  $x^5$ ,  $x^6$ , etc.

We would need A LOT of time to talk about each one individually

# Introduction to Polynomials

So far, the two functions that we explored most deeply are:

Linear functions:

$$y = f(x) = mx^1 + bx^0$$

Quadratic functions:

$$y = f(x) = ax^2 + bx^1 + cx^0$$

Notice the similarity between these.

Although it might not be obvious at first glance, in both of them we are adding up powers of  $x$

The jump from linear to quadratic meant we included  $x^2$

And after that  $x^5$ ,  $x^6$ , etc.

We would need A LOT of time to talk about each one individually

So, let's study them all at once!

A *Polynomial* is a function of the form:

# Introduction to Polynomials

So far, the two functions that we explored most deeply are:

Linear functions:

$$y = f(x) = mx^1 + bx^0$$

Quadratic functions:

$$y = f(x) = ax^2 + bx^1 + cx^0$$

Notice the similarity between these.

Although it might not be obvious at first glance, in both of them we are adding up powers of  $x$

The jump from linear to quadratic meant we included  $x^2$

So, the next logical step is to see what happens if we include  $x^3$

But then we'll need to include  $x^4$

And after that  $x^5$ ,  $x^6$ , etc.

We would need A LOT of time to talk about each one individually

So, let's study them all at once!

A *Polynomial* is a function of the form:

$$y = a_n x^n + a_{n-1} x^{n-1} + \cdots + a_2 x^2 + a_1 x + a_0$$

# Introduction to Polynomials

So far, the two functions that we explored most deeply are:

Linear functions:

$$y = f(x) = mx^1 + bx^0$$

Quadratic functions:

$$y = f(x) = ax^2 + bx^1 + cx^0$$

Notice the similarity between these.

Although it might not be obvious at first glance, in both of them we are adding up powers of  $x$

The jump from linear to quadratic meant we included  $x^2$

So, the next logical step is to see what happens if we include  $x^3$

But then we'll need to include  $x^4$

And after that  $x^5$ ,  $x^6$ , etc.

We would need A LOT of time to talk about each one individually

So, let's study them all at once!

A *Polynomial* is a function of the form:

$$y = a_n x^n + a_{n-1} x^{n-1} + \cdots + a_2 x^2 + a_1 x + a_0$$

The highest power of  $x$ , in this case  $n$ , is called the *degree*

# Introduction to Polynomials

So far, the two functions that we explored most deeply are:

Linear functions:

$$y = f(x) = mx^1 + bx^0$$

Quadratic functions:

$$y = f(x) = ax^2 + bx^1 + cx^0$$

Notice the similarity between these.

Although it might not be obvious at first glance, in both of them we are adding up powers of  $x$

The jump from linear to quadratic meant we included  $x^2$

So, the next logical step is to see what happens if we include  $x^3$

But then we'll need to include  $x^4$

And after that  $x^5$ ,  $x^6$ , etc.

We would need A LOT of time to talk about each one individually

So, let's study them all at once!

A *Polynomial* is a function of the form:

$$y = \mathbf{a_n}x^n + \mathbf{a_{n-1}}x^{n-1} + \cdots + \mathbf{a_2}x^2 + \mathbf{a_1}x + \mathbf{a_0}$$

The highest power of  $x$ , in this case  $n$ , is called the *degree*

Because  $n$  can be big, we don't use  $a$ ,  $b$ ,  $c$ , etc. for the *coefficients*

# Introduction to Polynomials

So far, the two functions that we explored most deeply are:

Linear functions:

$$y = f(x) = mx^1 + bx^0$$

Quadratic functions:

$$y = f(x) = ax^2 + bx^1 + cx^0$$

Notice the similarity between these.
