Revisiting Vertex Form

Revisiting Vertex Form

Recall: Before we found the Quadratic Formula (and the way we found the Quadratic Formula), we solved equations:

$$ax^2 + bx + c = 0$$

Revisiting Vertex Form

Recall: Before we found the Quadratic Formula (and the way we found the Quadratic Formula), we solved equations:

$$ax^2 + bx + c = 0$$

By putting them in the form:

$$a(x - h)^2 + k$$

Revisiting Vertex Form

Recall: Before we found the Quadratic Formula (and the way we found the Quadratic Formula), we solved equations:

$$ax^2 + bx + c = 0$$

By putting them in the form:

$$a(x-h)^2 + k$$

It was a time-consuming and difficult process! ▸ Example

Revisiting Vertex Form

Recall: Before we found the Quadratic Formula (and the way we found the Quadratic Formula), we solved equations:

$$ax^2 + bx + c = 0$$

By putting them in the form:

$$a(x - h)^2 + k$$

It was a time-consuming and difficult process! ▸ Example

▸ We have now seen that the values (h, k) are the coordinates of the Vertex.

Revisiting Vertex Form

Recall: Before we found the Quadratic Formula (and the way we found the Quadratic Formula), we solved equations:

$$ax^2 + bx + c = 0$$

By putting them in the form:

$$a(x-h)^2 + k$$

It was a time-consuming and difficult process! ▸ Example

▸ We have now seen that the values (h, k) are the coordinates of the Vertex.

For this reason, we call this the *Vertex Form*

Revisiting Vertex Form

Recall: Before we found the Quadratic Formula (and the way we found the Quadratic Formula), we solved equations:

$$ax^2 + bx + c = 0$$

By putting them in the form:

$$a(x - h)^2 + k$$

It was a time-consuming and difficult process! ▸ Example

▸ We have now seen that the values (h, k) are the coordinates of the Vertex.

For this reason, we call this the *Vertex Form*

We now have a shortcut to find the values of h and k

Revisiting Vertex Form

$$ax^2 + bx + c = 0$$

By putting them in the form:

$$a(x-h)^2 + k$$

It was a time-consuming and difficult process! ▸ Example

▸ We have now seen that the values (h, k) are the coordinates of the Vertex.

For this reason, we call this the *Vertex Form*

We now have a shortcut to find the values of h and k

$h = \frac{-b}{2a}$ and $k = f(h)$

Revisiting Vertex Form

Recall: Before we found the Quadratic Formula (and the way we found the Quadratic Formula), we solved equations:

$$ax^2 + bx + c = 0$$

By putting them in the form:

$$a(x - h)^2 + k$$

It was a time-consuming and difficult process! ▸ Example

▸ We have now seen that the values (h, k) are the coordinates of the Vertex.

For this reason, we call this the *Vertex Form*

We now have a shortcut to find the values of h and k

$h = \frac{-b}{2a}$ and $k = f(h)$

Example: Put $2x^2 - 4x + 5$ into Vertex form

Revisiting Vertex Form

Recall: Before we found the Quadratic Formula (and the way we found the Quadratic Formula), we solved equations:

$$ax^2 + bx + c = 0$$

By putting them in the form:

$$a(x-h)^2 + k$$

It was a time-consuming and difficult process! ▸ Example

▸ We have now seen that the values (h, k) are the coordinates of the Vertex.

For this reason, we call this the *Vertex Form*

We now have a shortcut to find the values of h and k

$h = \frac{-b}{2a}$ and $k = f(h)$

Example: Put $2x^2 - 4x + 5$ into Vertex form

$$h = \frac{-(-4)}{2 \cdot 2}$$

Revisiting Vertex Form

Recall: Before we found the Quadratic Formula (and the way we found the Quadratic Formula), we solved equations:

$$ax^2 + bx + c = 0$$

By putting them in the form:

$$a\left(x - h\right)^2 + k$$

It was a time-consuming and difficult process! ▸ Example

▸ We have now seen that the values (h, k) are the coordinates of the Vertex.

For this reason, we call this the *Vertex Form*

We now have a shortcut to find the values of h and k

$h = \frac{-b}{2a}$ and $k = f(h)$

Example: Put $2x^2 - 4x + 5$ into Vertex form

$$\begin{aligned} h &= \frac{-(-4)}{2 \cdot 2} \\ &= \frac{4}{4} \end{aligned}$$

Revisiting Vertex Form

Recall: Before we found the Quadratic Formula (and the way we found the Quadratic Formula), we solved equations:

$$ax^2 + bx + c = 0$$

By putting them in the form:

$$a(x-h)^2 + k$$

It was a time-consuming and difficult process! ▸ Example

▸ We have now seen that the values (h, k) are the coordinates of the Vertex.

For this reason, we call this the *Vertex Form*

We now have a shortcut to find the values of h and k

$h = \frac{-b}{2a}$ and $k = f(h)$

Example: Put $2x^2 - 4x + 5$ into Vertex form

$$\begin{aligned} h &= \frac{-(-4)}{2 \cdot 2} \\ &= \frac{4}{4} \\ &= 1 \end{aligned}$$

Revisiting Vertex Form

Recall: Before we found the Quadratic Formula (and the way we found the Quadratic Formula), we solved equations:

$$ax^2 + bx + c = 0$$

By putting them in the form:

$$a(x - h)^2 + k$$

It was a time-consuming and difficult process! ▸ Example

▸ We have now seen that the values (h, k) are the coordinates of the Vertex.

For this reason, we call this the *Vertex Form*

We now have a shortcut to find the values of h and k

$h = \frac{-b}{2a}$ and $k = f(h)$

Example: Put $2x^2 - 4x + 5$ into Vertex form

$$h = \frac{-(-4)}{2 \cdot 2} = \frac{4}{4} = 1$$

$$k = f(1)$$

Revisiting Vertex Form

Recall: Before we found the Quadratic Formula (and the way we found the Quadratic Formula), we solved equations:

$$ax^2 + bx + c = 0$$

By putting them in the form:

$$a(x-h)^2 + k$$

It was a time-consuming and difficult process! ▸ Example

▸ We have now seen that the values (h, k) are the coordinates of the Vertex.

For this reason, we call this the *Vertex Form*

We now have a shortcut to find the values of h and k

$h = \frac{-b}{2a}$ and $k = f(h)$

Example: Put $2x^2 - 4x + 5$ into Vertex form

$$h = \frac{-(-4)}{2 \cdot 2} = \frac{4}{4} = 1$$

$$k = f(1) = 2 \cdot 1^2 - 4 \cdot 1 + 5$$

Revisiting Vertex Form

Recall: Before we found the Quadratic Formula (and the way we found the Quadratic Formula), we solved equations:

$$ax^2 + bx + c = 0$$

By putting them in the form:

$$a\left(x - h\right)^2 + k$$

It was a time-consuming and difficult process! ▸ Example

▸ We have now seen that the values (h, k) are the coordinates of the Vertex.

For this reason, we call this the *Vertex Form*

We now have a shortcut to find the values of h and k

$h = \frac{-b}{2a}$ and $k = f(h)$

Example: Put $2x^2 - 4x + 5$ into Vertex form

$$h = \frac{-(-4)}{2 \cdot 2} = \frac{4}{4} = 1$$

$$k = f\left(1\right) = 2 \cdot 1^2 - 4 \cdot 1 + 5 = 2 - 4 + 5 = 3$$

Revisiting Vertex Form

Recall: Before we found the Quadratic Formula (and the way we found the Quadratic Formula), we solved equations:

$$ax^2 + bx + c = 0$$

By putting them in the form:

$$a(x - h)^2 + k$$

It was a time-consuming and difficult process! ▸ Example

▸ We have now seen that the values (h, k) are the coordinates of the Vertex.

For this reason, we call this the *Vertex Form*

We now have a shortcut to find the values of h and k

$h = \frac{-b}{2a}$ and $k = f(h)$

Example: Put $2x^2 - 4x + 5$ into Vertex form

$$h = \frac{-(-4)}{2 \cdot 2} = \frac{4}{4} = 1$$

$$k = f(1) = 2 \cdot 1^2 - 4 \cdot 1 + 5 = 2 - 4 + 5 = 3$$

Since $h = 1$ and $k = 3$ and we can clearly see $a = 2$, the vertex form is:

Revisiting Vertex Form

Recall: Before we found the Quadratic Formula (and the way we found the Quadratic Formula), we solved equations:

$$ax^2 + bx + c = 0$$

By putting them in the form:

It was a time-consuming and difficult process! ▸ Example

▸ We have now seen that the values (h, k) are the coordinates of the Vertex.

For this reason, we call this the *Vertex Form*

We now have a shortcut to find the values of h and k

$h = \frac{-b}{2a}$ and $k = f(h)$

Example: Put $2x^2 - 4x + 5$ into Vertex form

$$h = \frac{-(-4)}{2 \cdot 2} = \frac{4}{4} = 1$$

$$k = f(1) = 2 \cdot 1^2 - 4 \cdot 1 + 5 = 2 - 4 + 5 = 3$$

Since $h = 1$ and $k = 3$ and we can clearly see $a = 2$, the vertex form is:

$$2x^2 - 4x + 5 = 2(x - 1)^2 + 3$$

Revisiting Vertex Form

Recall: Before we found the Quadratic Formula (and the way we found the Quadratic Formula), we solved equations:

$$ax^2 + bx + c = 0$$

By putting them in the form:

$$a\left(x - h\right)^2 + k$$

It was a time-consuming and difficult process! ▸ Example

▸ We have now seen that the values (h, k) are the coordinates of the Vertex.

For this reason, we call this the *Vertex Form*

We now have a shortcut to find the values of h and k

$h = \frac{-b}{2a}$ and $k = f(h)$

Example: Put $2x^2 - 4x + 5$ into Vertex form

$$h = \frac{-(-4)}{2 \cdot 2} = \frac{4}{4} = 1$$

$$k = f(1) = 2 \cdot 1^2 - 4 \cdot 1 + 5 = 2 - 4 + 5 = 3$$

Since $h = 1$ and $k = 3$ and we can clearly see $a = 2$, the vertex form is:

$$2x^2 - 4x + 5 = 2\left(x - 1\right)^2 + 3$$

Notice that this method is a much faster process than we had before, but we needed to understand the graph to use this method
