

## Warning about Solving Radical Equations

## Warning about Solving Radical Equations

► We saw that we might come across a value that seems to be a solution, but is not an actual solution.

## Warning about Solving Radical Equations

► We saw that we might come across a value that seems to be a solution, but is not an actual solution.

We didn't make a mistake in our calculations.

## Warning about Solving Radical Equations

► We saw that we might come across a value that seems to be a solution, but is not an actual solution.

We didn't make a mistake in our calculations.

What happened?

## Warning about Solving Radical Equations

► We saw that we might come across a value that seems to be a solution, but is not an actual solution.

We didn't make a mistake in our calculations.

What happened?

The issue arose when we squared both sides of the equation.

## Warning about Solving Radical Equations

► We saw that we might come across a value that seems to be a solution, but is not an actual solution.

We didn't make a mistake in our calculations.

What happened?

The issue arose when we squared both sides of the equation.

Let's look at a very simple example to explore further.

## Warning about Solving Radical Equations

► We saw that we might come across a value that seems to be a solution, but is not an actual solution.

We didn't make a mistake in our calculations.

What happened?

The issue arose when we squared both sides of the equation.

Let's look at a very simple example to explore further.

The equation  $x = 1$  has one solution, which is  $x = 1$

## Warning about Solving Radical Equations

► We saw that we might come across a value that seems to be a solution, but is not an actual solution.

We didn't make a mistake in our calculations.

What happened?

The issue arose when we squared both sides of the equation.

Let's look at a very simple example to explore further.

The equation  $x = 1$  has one solution, which is  $x = 1$ .  
If we square both sides of the equation, though, we get:

## Warning about Solving Radical Equations

► We saw that we might come across a value that seems to be a solution, but is not an actual solution.

We didn't make a mistake in our calculations.

What happened?

The issue arose when we squared both sides of the equation.

Let's look at a very simple example to explore further.

The equation  $x = 1$  has one solution, which is  $x = 1$   
If we square both sides of the equation, though, we get:

$$x^2 = 1^2$$

## Warning about Solving Radical Equations

► We saw that we might come across a value that seems to be a solution, but is not an actual solution.

We didn't make a mistake in our calculations.

What happened?

The issue arose when we squared both sides of the equation.

Let's look at a very simple example to explore further.

The equation  $x = 1$  has one solution, which is  $x = 1$

If we square both sides of the equation, though, we get:

$$x^2 = 1^2$$

$$x^2 = 1$$

## Warning about Solving Radical Equations

► We saw that we might come across a value that seems to be a solution, but is not an actual solution.

We didn't make a mistake in our calculations.

What happened?

The issue arose when we squared both sides of the equation.

Let's look at a very simple example to explore further.

The equation  $x = 1$  has one solution, which is  $x = 1$

If we square both sides of the equation, though, we get:

$$x^2 = 1^2$$

$$x^2 = 1$$

Now that we've squared the equation, we have two solutions!

## Warning about Solving Radical Equations

► We saw that we might come across a value that seems to be a solution, but is not an actual solution.

We didn't make a mistake in our calculations.

What happened?

The issue arose when we squared both sides of the equation.

Let's look at a very simple example to explore further.

The equation  $x = 1$  has one solution, which is  $x = 1$

If we square both sides of the equation, though, we get:

$$x^2 = 1^2$$

$$x^2 = 1$$

Now that we've squared the equation, we have two solutions!

- $x = 1$  (the solution to the original equation).

## Warning about Solving Radical Equations

► We saw that we might come across a value that seems to be a solution, but is not an actual solution.

We didn't make a mistake in our calculations.

What happened?

The issue arose when we squared both sides of the equation.

Let's look at a very simple example to explore further.

The equation  $x = 1$  has one solution, which is  $x = 1$

If we square both sides of the equation, though, we get:

$$x^2 = 1^2$$

$$x^2 = 1$$

Now that we've squared the equation, we have two solutions!

- $x = 1$  (the solution to the original equation).
- $x = -1$  (a solution of the squared equation, but not the original)

## Warning about Solving Radical Equations

► We saw that we might come across a value that seems to be a solution, but is not an actual solution.

We didn't make a mistake in our calculations.

What happened?

The issue arose when we squared both sides of the equation.

Let's look at a very simple example to explore further.

The equation  $x = 1$  has one solution, which is  $x = 1$

If we square both sides of the equation, though, we get:

$$x^2 = 1^2$$

$$x^2 = 1$$

Now that we've squared the equation, we have two solutions!

- $x = 1$  (the solution to the original equation).
- $x = -1$  (a solution of the squared equation, but not the original)

**Conclusion:** Whenever we square both sides of an equation, we *must* check our solution(s) in the original equation (before it was squared) to see which values are solutions of the original equation.
