

Graphing Rational Functions - Vertical Asymptotes

Graphing Rational Functions - Vertical Asymptotes

► We defined a Rational Function as:

$$f(x) = \frac{P(x)}{D(x)}$$

Graphing Rational Functions - Vertical Asymptotes

► We defined a Rational Function as:

$$f(x) = \frac{P(x)}{D(x)}$$

We saw that these functions are undefined for x so $D(x) = 0$

Graphing Rational Functions - Vertical Asymptotes

▶ We defined a Rational Function as:

$$f(x) = \frac{P(x)}{D(x)}$$

We saw that these functions are undefined for x so $D(x) = 0$

▶ We saw with the function $f(x) = \frac{1}{x}$ that $f(x)$ is undefined at $x = 0$

Graphing Rational Functions - Vertical Asymptotes

► We defined a Rational Function as:

$$f(x) = \frac{P(x)}{D(x)}$$

We saw that these functions are undefined for x so $D(x) = 0$

► We saw with the function $f(x) = \frac{1}{x}$ that $f(x)$ is undefined at $x = 0$
Furthermore, we saw that as x got closer and closer to 0, $f(x)$ is the reciprocal of a smaller and smaller number, resulting in a larger and larger number.

Graphing Rational Functions - Vertical Asymptotes

► We defined a Rational Function as:

$$f(x) = \frac{P(x)}{D(x)}$$

We saw that these functions are undefined for x so $D(x) = 0$

► We saw with the function $f(x) = \frac{1}{x}$ that $f(x)$ is undefined at $x = 0$. Furthermore, we saw that as x got closer and closer to 0, $f(x)$ is the reciprocal of a smaller and smaller number, resulting in a larger and larger number.

In General: If $P(a) \neq 0$ and $D(a) = 0$ then

$$f(x) = \frac{P(x)}{D(x)}$$

is very large for x near a

Graphing Rational Functions - Vertical Asymptotes

► We defined a Rational Function as:

$$f(x) = \frac{P(x)}{D(x)}$$

We saw that these functions are undefined for x so $D(x) = 0$

► We saw with the function $f(x) = \frac{1}{x}$ that $f(x)$ is undefined at $x = 0$. Furthermore, we saw that as x got closer and closer to 0, $f(x)$ is the reciprocal of a smaller and smaller number, resulting in a larger and larger number.

In General: If $P(a) \neq 0$ and $D(a) = 0$ then

$$f(x) = \frac{P(x)}{D(x)}$$

is very large for x near a

We say that $x = a$ is a

vertical asymptote

Graphing Rational Functions - Vertical Asymptotes

► We defined a Rational Function as:

$$f(x) = \frac{P(x)}{D(x)}$$

We saw that these functions are undefined for x so $D(x) = 0$

► We saw with the function $f(x) = \frac{1}{x}$ that $f(x)$ is undefined at $x = 0$

Furthermore, we saw that as x got closer and closer to 0, $f(x)$ is the reciprocal of a smaller and smaller number, resulting in a larger and larger number.

In General: If $P(a) \neq 0$ and $D(a) = 0$ then

$$f(x) = \frac{P(x)}{D(x)}$$

is very large for x near a

We say that $x = a$ is a

vertical asymptote

Graphically, a vertical asymptote

is a vertical line where

$f(x) \rightarrow \pm\infty$
