

Solving Quadratic Equations with Factoring - Example 4

Solving Quadratic Equations with Factoring - Example 4

Example: Find the ▶ Roots of:

$$x^2 + 6x + 9$$

Solving Quadratic Equations with Factoring - Example 4

Example: Find the ▶ Roots of:

$$x^2 + 6x + 9$$

Recall: The roots (also called zeroes) are the values of x so that:

$$x^2 + 6x + 9 = 0$$

Solving Quadratic Equations with Factoring - Example 4

Example: Find the **Roots** of:

$$x^2 + 6x + 9$$

Recall: The roots (also called zeroes) are the values of x so that:

$$x^2 + 6x + 9 = 0$$

To solve this equation, we need to **Factor**:

Solving Quadratic Equations with Factoring - Example 4

Example: Find the **Roots** of:

$$x^2 + 6x + 9$$

Recall: The roots (also called zeroes) are the values of x so that:

$$x^2 + 6x + 9 = 0$$

To solve this equation, we need to **Factor**: $x^2 + 6x + 9 = (x + 3)(x + 3)$

Solving Quadratic Equations with Factoring - Example 4

Example: Find the **Roots** of:

$$x^2 + 6x + 9$$

Recall: The roots (also called zeroes) are the values of x so that:

$$x^2 + 6x + 9 = 0$$

To solve this equation, we need to **Factor**: $x^2 + 6x + 9 = (x + 3)(x + 3)$

We want to know when this is 0:

Solving Quadratic Equations with Factoring - Example 4

Example: Find the **Roots** of:

$$x^2 + 6x + 9$$

Recall: The roots (also called zeroes) are the values of x so that:

$$x^2 + 6x + 9 = 0$$

To solve this equation, we need to **Factor**: $x^2 + 6x + 9 = (x + 3)(x + 3)$

We want to know when this is 0:

$$(x + 3) \cdot (x + 3) = 0$$

Solving Quadratic Equations with Factoring - Example 4

Example: Find the **Roots** of:

$$x^2 + 6x + 9$$

Recall: The roots (also called zeroes) are the values of x so that:

$$x^2 + 6x + 9 = 0$$

To solve this equation, we need to **Factor**: $x^2 + 6x + 9 = (x + 3)(x + 3)$

We want to know when this is 0:

$$(x + 3) \cdot (x + 3) = 0$$

By the **Zero-Product Property** either: $(x + 3) = 0$ OR $(x + 3) = 0$

Solving Quadratic Equations with Factoring - Example 4

Example: Find the **Roots** of:

$$x^2 + 6x + 9$$

Recall: The roots (also called zeroes) are the values of x so that:

$$x^2 + 6x + 9 = 0$$

To solve this equation, we need to **Factor**: $x^2 + 6x + 9 = (x + 3)(x + 3)$

We want to know when this is 0:

$$(x + 3) \cdot (x + 3) = 0$$

By the **Zero-Product Property** either: $(x + 3) = 0$ OR $(x + 3) = 0$

Solving each of these equations, we get: $x = -3$ OR -3

Solving Quadratic Equations with Factoring - Example 4

Example: Find the **Roots** of:

$$x^2 + 6x + 9$$

Recall: The roots (also called zeroes) are the values of x so that:

$$x^2 + 6x + 9 = 0$$

To solve this equation, we need to **Factor**: $x^2 + 6x + 9 = (x + 3)(x + 3)$

We want to know when this is 0:

$$(x + 3) \cdot (x + 3) = 0$$

By the **Zero-Product Property** either: $(x + 3) = 0$ OR $(x + 3) = 0$

Solving each of these equations, we get: $x = -3$ OR -3

Conclusion: The roots to $x^2 + 6x + 9$ are: $x = -3, -3$

Solving Quadratic Equations with Factoring - Example 4

Example: Find the **Roots** of:

$$x^2 + 6x + 9$$

Recall: The roots (also called zeroes) are the values of x so that:

$$x^2 + 6x + 9 = 0$$

To solve this equation, we need to **Factor**: $x^2 + 6x + 9 = (x + 3)(x + 3)$

We want to know when this is 0:

$$(x + 3) \cdot (x + 3) = 0$$

By the **Zero-Product Property** either: $(x + 3) = 0$ OR $(x + 3) = 0$

Solving each of these equations, we get: $x = -3$ OR -3

Conclusion: The roots to $x^2 + 6x + 9$ are: $x = -3, -3$

Here we have just one distinct root, -3 , but it shows up in both factors.

Solving Quadratic Equations with Factoring - Example 4

Example: Find the **Roots** of:

$$x^2 + 6x + 9$$

Recall: The roots (also called zeroes) are the values of x so that:

$$x^2 + 6x + 9 = 0$$

To solve this equation, we need to **Factor**: $x^2 + 6x + 9 = (x + 3)(x + 3)$

We want to know when this is 0:

$$(x + 3) \cdot (x + 3) = 0$$

By the **Zero-Product Property** either: $(x + 3) = 0$ OR $(x + 3) = 0$

Solving each of these equations, we get: $x = -3$ OR -3

Conclusion: The roots to $x^2 + 6x + 9$ are: $x = -3, -3$

Here we have just one distinct root, -3 , but it shows up in both factors.

To capture this, we say that -3 is a roots to $x^2 + 6x + 9$ of *multiplicity 2*
