Putting $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$

Putting $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$

To put $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$ we need to know the values of a, h, and k so that:

$$2x^2 - 12x + 4 = a(x-h)^2 + k$$

Putting $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$

To put $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$ we need to know the values of a, h, and k so that:

$$2x^2 - 12x + 4 = a(x-h)^2 + k$$

So, how do we do that if these are written so differently?

Putting $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$

To put $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$ we need to know the values of a, h, and k so that:

$$2x^2 - 12x + 4 = a(x-h)^2 + k$$

So, how do we do that if these are written so differently?

We can write the right-hand side like the left-hand side by ▸ distributing

Putting $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$

To put $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$ we need to know the values of a, h, and k so that:

$$\begin{aligned} 2x^2 - 12x + 4 &= a(x-h)^2 + k \\ &= a(x-h)(x-h) + k \end{aligned}$$

So, how do we do that if these are written so differently?

We can write the right-hand side like the left-hand side by ▸ distributing

Putting $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$

To put $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$ we need to know the values of a, h, and k so that:

$$\begin{aligned} 2x^2 - 12x + 4 &= a(x-h)^2 + k \\ &= a(x-h)(x-h) + k \\ &= a(x^2 - 2hx + h^2) + k \end{aligned}$$

So, how do we do that if these are written so differently?

We can write the right-hand side like the left-hand side by ▸ distributing

Putting $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$

To put $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$ we need to know the values of a, h, and k so that:

$$\begin{aligned} 2x^2 - 12x + 4 &= a(x-h)^2 + k \\ &= a(x-h)(x-h) + k \\ &= a(x^2 - 2hx + h^2) + k \\ &= ax^2 - 2ahx + ah^2 + k \end{aligned}$$

So, how do we do that if these are written so differently?

We can write the right-hand side like the left-hand side by ▸ distributing

Putting $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$

To put $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$ we need to know the values of a, h, and k so that:

$$\begin{aligned} 2x^2 - 12x + 4 &= a(x-h)^2 + k \\ &= a(x-h)(x-h) + k \\ &= a(x^2 - 2hx + h^2) + k \\ &= ax^2 - 2ahx + ah^2 + k \end{aligned}$$

So, how do we do that if these are written so differently?

We can write the right-hand side like the left-hand side by ▸ distributing

After distributing on the right-hand side, we are left with:

Putting $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$

To put $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$ we need to know the values of a, h, and k so that:

$$\begin{aligned} 2x^2 - 12x + 4 &= a(x-h)^2 + k \\ &= a(x-h)(x-h) + k \\ &= a(x^2 - 2hx + h^2) + k \\ &= ax^2 - 2ahx + ah^2 + k \end{aligned}$$

So, how do we do that if these are written so differently?

We can write the right-hand side like the left-hand side by ▸ distributing

After distributing on the right-hand side, we are left with:

$$2x^2 - 12x + 4 = ax^2 - 2ahx + ah^2 + k$$

Putting $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$

To put $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$ we need to know the values of a, h, and k so that:

$$\begin{aligned} 2x^2 - 12x + 4 &= a(x-h)^2 + k \\ &= a(x-h)(x-h) + k \\ &= a(x^2 - 2hx + h^2) + k \\ &= ax^2 - 2ahx + ah^2 + k \end{aligned}$$

So, how do we do that if these are written so differently?

We can write the right-hand side like the left-hand side by ▸ distributing

After distributing on the right-hand side, we are left with:

$$2x^2 - 12x + 4 = ax^2 - 2ahx + ah^2 + k$$

We want these to be the same (equal) for every x.

Putting $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$

To put $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$ we need to know the values of a, h, and k so that:

$$\begin{aligned} 2x^2 - 12x + 4 &= a(x-h)^2 + k \\ &= a(x-h)(x-h) + k \\ &= a(x^2 - 2hx + h^2) + k \\ &= ax^2 - 2ahx + ah^2 + k \end{aligned}$$

So, how do we do that if these are written so differently?

We can write the right-hand side like the left-hand side by ▸ distributing

After distributing on the right-hand side, we are left with:

$$2x^2 - 12x + 4 = ax^2 - 2ahx + ah^2 + k$$

We want these to be the same (equal) for every x.

So, we need:

$2 = a$

Putting $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$

To put $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$ we need to know the values of a, h, and k so that:

$$\begin{aligned} 2x^2 - 12x + 4 &= a(x-h)^2 + k \\ &= a(x-h)(x-h) + k \\ &= a(x^2 - 2hx + h^2) + k \\ &= ax^2 - 2ahx + ah^2 + k \end{aligned}$$

So, how do we do that if these are written so differently?

We can write the right-hand side like the left-hand side by ▸ distributing

After distributing on the right-hand side, we are left with:

$$2x^2 - 12x + 4 = ax^2 - 2ahx + ah^2 + k$$

We want these to be the same (equal) for every x.

So, we need:

$2 = a$

$-12 = -2ah$

Putting $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$

To put $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$ we need to know the values of a, h, and k so that:

$$\begin{aligned} 2x^2 - 12x + 4 &= a(x-h)^2 + k \\ &= a(x-h)(x-h) + k \\ &= a(x^2 - 2hx + h^2) + k \\ &= ax^2 - 2ahx + ah^2 + k \end{aligned}$$

So, how do we do that if these are written so differently?

We can write the right-hand side like the left-hand side by ▸ distributing

After distributing on the right-hand side, we are left with:

$$2x^2 - 12x + 4 = ax^2 - 2ahx + ah^2 + k$$

We want these to be the same (equal) for every x.

So, we need:

$2 = a$

$-12 = -2ah$

$4 = a \cdot h^2 + k$

Putting $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$

To put $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$ we need to know the values of a, h, and k so that:

$$\begin{aligned} 2x^2 - 12x + 4 &= a(x-h)^2 + k \\ &= a(x-h)(x-h) + k \\ &= a(x^2 - 2hx + h^2) + k \\ &= ax^2 - 2ahx + ah^2 + k \end{aligned}$$

So, how do we do that if these are written so differently?

We can write the right-hand side like the left-hand side by ▸ distributing

After distributing on the right-hand side, we are left with:

$$2x^2 - 12x + 4 = ax^2 - 2ahx + ah^2 + k$$

We want these to be the same (equal) for every x.

So, we need:

$\mathbf{2 = a}$

$-12 = -2ah$

$4 = a \cdot h^2 + k$

Putting $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$

To put $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$ we need to know the values of a, h, and k so that:

$$\begin{aligned} 2x^2 - 12x + 4 &= a(x-h)^2 + k \\ &= a(x-h)(x-h) + k \\ &= a(x^2 - 2hx + h^2) + k \\ &= ax^2 - 2ahx + ah^2 + k \end{aligned}$$

So, how do we do that if these are written so differently?

We can write the right-hand side like the left-hand side by ▸ distributing

After distributing on the right-hand side, we are left with:

$$2x^2 - 12x + 4 = ax^2 - 2ahx + ah^2 + k$$

We want these to be the same (equal) for every x.

So, we need:

$\mathbf{2 = a}$

$-12 = -2ah = -2 \cdot 2h$

$4 = a \cdot h^2 + k$

Putting $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$

To put $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$ we need to know the values of a, h, and k so that:

$$\begin{aligned} 2x^2 - 12x + 4 &= a(x-h)^2 + k \\ &= a(x-h)(x-h) + k \\ &= a(x^2 - 2hx + h^2) + k \\ &= ax^2 - 2ahx + ah^2 + k \end{aligned}$$

So, how do we do that if these are written so differently?

We can write the right-hand side like the left-hand side by ▸ distributing

After distributing on the right-hand side, we are left with:

$$2x^2 - 12x + 4 = ax^2 - 2ahx + ah^2 + k$$

We want these to be the same (equal) for every x.

So, we need:

$\mathbf{2 = a}$

$-12 = -2ah = -2 \cdot 2h = -4h$

$4 = a \cdot h^2 + k$

Putting $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$

To put $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$ we need to know the values of a, h, and k so that:

$$\begin{aligned} 2x^2 - 12x + 4 &= a(x-h)^2 + k \\ &= a(x-h)(x-h) + k \\ &= a(x^2 - 2hx + h^2) + k \\ &= ax^2 - 2ahx + ah^2 + k \end{aligned}$$

So, how do we do that if these are written so differently?

We can write the right-hand side like the left-hand side by ▸ distributing

After distributing on the right-hand side, we are left with:

$$2x^2 - 12x + 4 = ax^2 - 2ahx + ah^2 + k$$

We want these to be the same (equal) for every x.

So, we need:

$\mathbf{2 = a}$

$-12 = -2ah = -2 \cdot 2h = -4h \rightarrow$ $\quad -12 = -4h$

$4 = a \cdot h^2 + k$

Putting $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$

To put $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$ we need to know the values of a, h, and k so that:

$$\begin{aligned} 2x^2 - 12x + 4 &= a(x-h)^2 + k \\ &= a(x-h)(x-h) + k \\ &= a(x^2 - 2hx + h^2) + k \\ &= ax^2 - 2ahx + ah^2 + k \end{aligned}$$

So, how do we do that if these are written so differently?

We can write the right-hand side like the left-hand side by ▸ distributing

After distributing on the right-hand side, we are left with:

$$2x^2 - 12x + 4 = ax^2 - 2ahx + ah^2 + k$$

We want these to be the same (equal) for every x.

So, we need:

$\mathbf{2 = a}$

$-12 = -2ah = -2 \cdot 2h = -4h \rightarrow \qquad \frac{-12}{-4} = \frac{-4h}{-4}$

$4 = a \cdot h^2 + k$

Putting $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$

To put $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$ we need to know the values of a, h, and k so that:

$$\begin{aligned} 2x^2 - 12x + 4 &= a(x-h)^2 + k \\ &= a(x-h)(x-h) + k \\ &= a(x^2 - 2hx + h^2) + k \\ &= ax^2 - 2ahx + ah^2 + k \end{aligned}$$

So, how do we do that if these are written so differently?

We can write the right-hand side like the left-hand side by ▸ distributing

After distributing on the right-hand side, we are left with:

$$2x^2 - 12x + 4 = ax^2 - 2ahx + ah^2 + k$$

We want these to be the same (equal) for every x.

So, we need:

$\mathbf{2 = a}$

$-12 = -2ah = -2 \cdot 2h = -4h \rightarrow 3 = \frac{-12}{-4} = \frac{-4h}{-4} = h$

$4 = a \cdot h^2 + k$

Putting $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$

To put $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$ we need to know the values of a, h, and k so that:

$$\begin{aligned} 2x^2 - 12x + 4 &= a(x-h)^2 + k \\ &= a(x-h)(x-h) + k \\ &= a(x^2 - 2hx + h^2) + k \\ &= ax^2 - 2ahx + ah^2 + k \end{aligned}$$

So, how do we do that if these are written so differently?

We can write the right-hand side like the left-hand side by ▸ distributing

After distributing on the right-hand side, we are left with:

$$2x^2 - 12x + 4 = ax^2 - 2ahx + ah^2 + k$$

We want these to be the same (equal) for every x.

So, we need:

$\mathbf{2 = a}$

$-12 = -2ah = -2 \cdot 2h = -4h \rightarrow \mathbf{3} = \frac{-12}{-4} = \frac{-4h}{-4} = \mathbf{h} \rightarrow \mathbf{h = 3}$

$4 = a \cdot h^2 + k$

Putting $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$

To put $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$ we need to know the values of a, h, and k so that:

$$\begin{aligned} 2x^2 - 12x + 4 &= a(x-h)^2 + k \\ &= a(x-h)(x-h) + k \\ &= a(x^2 - 2hx + h^2) + k \\ &= ax^2 - 2ahx + ah^2 + k \end{aligned}$$

So, how do we do that if these are written so differently?

We can write the right-hand side like the left-hand side by ▸ distributing

After distributing on the right-hand side, we are left with:

$$2x^2 - 12x + 4 = ax^2 - 2ahx + ah^2 + k$$

We want these to be the same (equal) for every x.

So, we need:

$\mathbf{2 = a}$

$-12 = -2ah = -2 \cdot 2h = -4h \rightarrow \mathbf{3} = \frac{-12}{-4} = \frac{-4h}{-4} = \mathbf{h} \rightarrow \mathbf{h = 3}$

$4 = a \cdot h^2 + k = 2 \cdot 3^2 + k$

Putting $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$

To put $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$ we need to know the values of a, h, and k so that:

$$\begin{aligned} 2x^2 - 12x + 4 &= a(x-h)^2 + k \\ &= a(x-h)(x-h) + k \\ &= a(x^2 - 2hx + h^2) + k \\ &= ax^2 - 2ahx + ah^2 + k \end{aligned}$$

So, how do we do that if these are written so differently?

We can write the right-hand side like the left-hand side by ▸ distributing

After distributing on the right-hand side, we are left with:

$$2x^2 - 12x + 4 = ax^2 - 2ahx + ah^2 + k$$

We want these to be the same (equal) for every x.

So, we need:

$\mathbf{2 = a}$

$-12 = -2ah = -2 \cdot 2h = -4h \rightarrow \mathbf{3} = \frac{-12}{-4} = \frac{-4h}{-4} = \mathbf{h} \rightarrow \mathbf{h = 3}$

$4 = a \cdot h^2 + k = 2 \cdot 3^2 + k = 2 \cdot 9 + k$

Putting $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$

To put $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$ we need to know the values of a, h, and k so that:

$$\begin{aligned} 2x^2 - 12x + 4 &= a(x-h)^2 + k \\ &= a(x-h)(x-h) + k \\ &= a(x^2 - 2hx + h^2) + k \\ &= ax^2 - 2ahx + ah^2 + k \end{aligned}$$

So, how do we do that if these are written so differently?

We can write the right-hand side like the left-hand side by ▸ distributing

After distributing on the right-hand side, we are left with:

$$2x^2 - 12x + 4 = ax^2 - 2ahx + ah^2 + k$$

We want these to be the same (equal) for every x.

So, we need:

$\mathbf{2 = a}$

$-12 = -2ah = -2 \cdot 2h = -4h \rightarrow \mathbf{3} = \frac{-12}{-4} = \frac{-4h}{-4} = \mathbf{h} \rightarrow \mathbf{h = 3}$

$4 = a \cdot h^2 + k = 2 \cdot 3^2 + k = 2 \cdot 9 + k = 18 + k$

Putting $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$

To put $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$ we need to know the values of a, h, and k so that:

$$\begin{aligned} 2x^2 - 12x + 4 &= a(x-h)^2 + k \\ &= a(x-h)(x-h) + k \\ &= a(x^2 - 2hx + h^2) + k \\ &= ax^2 - 2ahx + ah^2 + k \end{aligned}$$

So, how do we do that if these are written so differently?

We can write the right-hand side like the left-hand side by ▸ distributing

After distributing on the right-hand side, we are left with:

$$2x^2 - 12x + 4 = ax^2 - 2ahx + ah^2 + k$$

We want these to be the same (equal) for every x.

So, we need:

$\mathbf{2 = a}$

$-12 = -2ah = -2 \cdot 2h = -4h \rightarrow \mathbf{3} = \frac{-12}{-4} = \frac{-4h}{-4} = \mathbf{h} \rightarrow \mathbf{h = 3}$

$4 = a \cdot h^2 + k = 2 \cdot 3^2 + k = 2 \cdot 9 + k = 18 + k \rightarrow 4 = 18 + k$

Putting $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$

To put $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$ we need to know the values of a, h, and k so that:

$$\begin{aligned} 2x^2 - 12x + 4 &= a(x-h)^2 + k \\ &= a(x-h)(x-h) + k \\ &= a(x^2 - 2hx + h^2) + k \\ &= ax^2 - 2ahx + ah^2 + k \end{aligned}$$

So, how do we do that if these are written so differently?

We can write the right-hand side like the left-hand side by ▸ distributing

After distributing on the right-hand side, we are left with:

$$2x^2 - 12x + 4 = ax^2 - 2ahx + ah^2 + k$$

We want these to be the same (equal) for every x.

So, we need:

$\mathbf{2 = a}$

$-12 = -2ah = -2 \cdot 2h = -4h \rightarrow \mathbf{3} = \frac{-12}{-4} = \frac{-4h}{-4} = \mathbf{h} \rightarrow \mathbf{h = 3}$

$4 = a \cdot h^2 + k = 2 \cdot 3^2 + k = 2 \cdot 9 + k = 18 + k \rightarrow 4 = 18 + k$

$\rightarrow k = 4 - 18$

Putting $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$

To put $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$ we need to know the values of a, h, and k so that:

$$\begin{aligned} 2x^2 - 12x + 4 &= a(x-h)^2 + k \\ &= a(x-h)(x-h) + k \\ &= a(x^2 - 2hx + h^2) + k \\ &= ax^2 - 2ahx + ah^2 + k \end{aligned}$$

So, how do we do that if these are written so differently?

We can write the right-hand side like the left-hand side by ▸ distributing

After distributing on the right-hand side, we are left with:

$$2x^2 - 12x + 4 = ax^2 - 2ahx + ah^2 + k$$

We want these to be the same (equal) for every x.

So, we need:

$\mathbf{2 = a}$

$-12 = -2ah = -2 \cdot 2h = -4h \rightarrow \mathbf{3} = \frac{-12}{-4} = \frac{-4h}{-4} = \mathbf{h} \rightarrow \mathbf{h = 3}$

$4 = a \cdot h^2 + k = 2 \cdot 3^2 + k = 2 \cdot 9 + k = 18 + k \rightarrow 4 = 18 + k$

$\rightarrow \mathbf{k} = 4 - 18 = \mathbf{-14}$

Putting $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$

To put $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$ we need to know the values of a, h, and k so that:

$$\begin{aligned} 2x^2 - 12x + 4 &= a(x-h)^2 + k \\ &= a(x-h)(x-h) + k \\ &= a(x^2 - 2hx + h^2) + k \\ &= ax^2 - 2ahx + ah^2 + k \end{aligned}$$

So, how do we do that if these are written so differently?

We can write the right-hand side like the left-hand side by ▸ distributing

After distributing on the right-hand side, we are left with:

$$2x^2 - 12x + 4 = ax^2 - 2ahx + ah^2 + k$$

We want these to be the same (equal) for every x.

So, we need:

$\mathbf{2 = a}$

$-12 = -2ah = -2 \cdot 2h = -4h \rightarrow \mathbf{3} = \frac{-12}{-4} = \frac{-4h}{-4} = \mathbf{h} \rightarrow \mathbf{h = 3}$

$4 = a \cdot h^2 + k = 2 \cdot 3^2 + k = 2 \cdot 9 + k = 18 + k \rightarrow 4 = 18 + k$

$\rightarrow \mathbf{k} = 4 - 18 = \mathbf{-14}$

Conclusion: We can re-write the polynomial in the form we want:

Putting $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$

To put $2x^2 - 12x + 4$ in the form: $a(x-h)^2 + k$ we need to know the values of a, h, and k so that:

$$\begin{aligned} 2x^2 - 12x + 4 &= a(x-h)^2 + k \\ &= a(x-h)(x-h) + k \\ &= a(x^2 - 2hx + h^2) + k \\ &= ax^2 - 2ahx + ah^2 + k \end{aligned}$$

So, how do we do that if these are written so differently?

We can write the right-hand side like the left-hand side by ▸ distributing

After distributing on the right-hand side, we are left with:

$$2x^2 - 12x + 4 = ax^2 - 2ahx + ah^2 + k$$

We want these to be the same (equal) for every x.

So, we need:

$\mathbf{2 = a}$

$-12 = -2ah = -2 \cdot 2h = -4h \rightarrow \mathbf{3} = \frac{-12}{-4} = \frac{-4h}{-4} = \mathbf{h} \rightarrow \mathbf{h = 3}$

$4 = a \cdot h^2 + k = 2 \cdot 3^2 + k = 2 \cdot 9 + k = 18 + k \rightarrow 4 = 18 + k$

$\rightarrow \mathbf{k} = 4 - 18 = \mathbf{-14}$

Conclusion: We can re-write the polynomial in the form we want:

$$2x^2 - 12x + 4 = 2(x-3)^2 - 14$$
