To put  $3x^2 - 12x + 1$  in the form:  $a(x - h)^2 + k$  we need to know the values of *a*, *h*, and *k* so that:

$$3x^2 - 12x + 1 = a(x - h)^2 + k$$

To put  $3x^2 - 12x + 1$  in the form:  $a(x - h)^2 + k$  we need to know the values of *a*, *h*, and *k* so that:

$$3x^2 - 12x + 1 = a(x - h)^2 + k$$

So, how do we do that if these are written so differently?

To put  $3x^2 - 12x + 1$  in the form:  $a(x - h)^2 + k$  we need to know the values of *a*, *h*, and *k* so that:

$$3x^2 - 12x + 1 = a(x - h)^2 + k$$

So, how do we do that if these are written so differently? We can write the right-hand side like the left-hand side by ristributing

To put  $3x^2 - 12x + 1$  in the form:  $a(x - h)^2 + k$  we need to know the values of *a*, *h*, and *k* so that:

$$3x^{2} - 12x + 1 = a(x - h)^{2} + k$$
  
= a(x - h)(x - h) + k

So, how do we do that if these are written so differently? We can write the right-hand side like the left-hand side by • distributing

To put  $3x^2 - 12x + 1$  in the form:  $a(x - h)^2 + k$  we need to know the values of *a*, *h*, and *k* so that:

$$3x^{2} - 12x + 1 = a(x - h)^{2} + k$$
  
=  $a(x - h)(x - h) + k$   
=  $a(x^{2} - 2hx + h^{2}) + k$ 

So, how do we do that if these are written so differently? We can write the right-hand side like the left-hand side by • distributing

To put  $3x^2 - 12x + 1$  in the form:  $a(x - h)^2 + k$  we need to know the values of *a*, *h*, and *k* so that:

$$3x^{2} - 12x + 1 = a(x - h)^{2} + k$$
  
=  $a(x - h)(x - h) + k$   
=  $a(x^{2} - 2hx + h^{2}) + k$   
=  $ax^{2} - 2ahx + ah^{2} + k$ 

So, how do we do that if these are written so differently? We can write the right-hand side like the left-hand side by • distributing

To put  $3x^2 - 12x + 1$  in the form:  $a(x - h)^2 + k$  we need to know the values of *a*, *h*, and *k* so that:

$$3x^{2} - 12x + 1 = a(x - h)^{2} + k$$
  
=  $a(x - h)(x - h) + k$   
=  $a(x^{2} - 2hx + h^{2}) + k$   
=  $ax^{2} - 2ahx + ah^{2} + k$ 

So, how do we do that if these are written so differently? We can write the right-hand side like the left-hand side by • distributing After distributing on the right-hand side, we are left with:

To put  $3x^2 - 12x + 1$  in the form:  $a(x - h)^2 + k$  we need to know the values of *a*, *h*, and *k* so that:

$$3x^{2} - 12x + 1 = a(x - h)^{2} + k$$
  
=  $a(x - h)(x - h) + k$   
=  $a(x^{2} - 2hx + h^{2}) + k$   
=  $ax^{2} - 2ahx + ah^{2} + k$ 

So, how do we do that if these are written so differently? We can write the right-hand side like the left-hand side by • distributing After distributing on the right-hand side, we are left with:

$$3x^2 - 12x + 1 = ax^2 - 2ahx + ah^2 + k$$

To put  $3x^2 - 12x + 1$  in the form:  $a(x - h)^2 + k$  we need to know the values of *a*, *h*, and *k* so that:

$$3x^{2} - 12x + 1 = a(x - h)^{2} + k$$
  
=  $a(x - h)(x - h) + k$   
=  $a(x^{2} - 2hx + h^{2}) + k$   
=  $ax^{2} - 2ahx + ah^{2} + k$ 

So, how do we do that if these are written so differently? We can write the right-hand side like the left-hand side by • distributing After distributing on the right-hand side, we are left with:

$$3x^2 - 12x + 1 = ax^2 - 2ahx + ah^2 + k$$

We want these to be the same (equal) for every x.

To put  $3x^2 - 12x + 1$  in the form:  $a(x - h)^2 + k$  we need to know the values of *a*, *h*, and *k* so that:

$$3x^{2} - 12x + 1 = a(x - h)^{2} + k$$
  
=  $a(x - h)(x - h) + k$   
=  $a(x^{2} - 2hx + h^{2}) + k$   
=  $ax^{2} - 2ahx + ah^{2} + k$ 

So, how do we do that if these are written so differently? We can write the right-hand side like the left-hand side by • distributing After distributing on the right-hand side, we are left with:

$$3x^2 - 12x + 1 = ax^2 - 2ahx + ah^2 + k$$

To put  $3x^2 - 12x + 1$  in the form:  $a(x - h)^2 + k$  we need to know the values of *a*, *h*, and *k* so that:

$$3x^{2} - 12x + 1 = a(x - h)^{2} + k$$
  
=  $a(x - h)(x - h) + k$   
=  $a(x^{2} - 2hx + h^{2}) + k$   
=  $ax^{2} - 2ahx + ah^{2} + k$ 

So, how do we do that if these are written so differently? We can write the right-hand side like the left-hand side by • distributing After distributing on the right-hand side, we are left with:

$$3x^2 - 12x + 1 = ax^2 - 2ahx + ah^2 + k$$

We want these to be the same (equal) for every *x*. So, we need: 3 = a-12 = -2ah

To put  $3x^2 - 12x + 1$  in the form:  $a(x - h)^2 + k$  we need to know the values of *a*, *h*, and *k* so that:

$$3x^{2} - 12x + 1 = a(x - h)^{2} + k$$
  
=  $a(x - h)(x - h) + k$   
=  $a(x^{2} - 2hx + h^{2}) + k$   
=  $ax^{2} - 2ahx + ah^{2} + k$ 

So, how do we do that if these are written so differently? We can write the right-hand side like the left-hand side by • distributing After distributing on the right-hand side, we are left with:

 $3x^2-12x + 1 = ax^2-2ahx + ah^2 + k$ We want these to be the same (equal) for every x. So, we need: 3 = a-12 = -2ah

 $1 = a \cdot h^2 + k$ 

To put  $3x^2 - 12x + 1$  in the form:  $a(x - h)^2 + k$  we need to know the values of *a*, *h*, and *k* so that:

$$3x^{2} - 12x + 1 = a(x - h)^{2} + k$$
  
=  $a(x - h)(x - h) + k$   
=  $a(x^{2} - 2hx + h^{2}) + k$   
=  $ax^{2} - 2ahx + ah^{2} + k$ 

So, how do we do that if these are written so differently? We can write the right-hand side like the left-hand side by • distributing After distributing on the right-hand side, we are left with:

$$3x^2 - 12x + 1 = ax^2 - 2ahx + ah^2 + k$$

We want these to be the same (equal) for every *x*. So, we need:

**3** = a -12 = -2ah $1 = a \cdot h^2 + k$ 

To put  $3x^2 - 12x + 1$  in the form:  $a(x - h)^2 + k$  we need to know the values of *a*, *h*, and *k* so that:

$$3x^{2} - 12x + 1 = a(x - h)^{2} + k$$
  
=  $a(x - h)(x - h) + k$   
=  $a(x^{2} - 2hx + h^{2}) + k$   
=  $ax^{2} - 2ahx + ah^{2} + k$ 

So, how do we do that if these are written so differently? We can write the right-hand side like the left-hand side by • distributing After distributing on the right-hand side, we are left with:

$$3x^2 - 12x + 1 = ax^2 - 2ahx + ah^2 + k$$

$$3 = a$$
  
-12 = -2ah = -2 · 3h  
1 = a · h<sup>2</sup> + k

To put  $3x^2 - 12x + 1$  in the form:  $a(x - h)^2 + k$  we need to know the values of *a*, *h*, and *k* so that:

$$3x^{2} - 12x + 1 = a(x - h)^{2} + k$$
  
=  $a(x - h)(x - h) + k$   
=  $a(x^{2} - 2hx + h^{2}) + k$   
=  $ax^{2} - 2ahx + ah^{2} + k$ 

So, how do we do that if these are written so differently? We can write the right-hand side like the left-hand side by • distributing After distributing on the right-hand side, we are left with:

$$3x^2 - 12x + 1 = ax^2 - 2ahx + ah^2 + k$$

$$3 = a$$
  
-12 = -2ah = -2 · 3h = -6h  
1 = a · h<sup>2</sup> + k

To put  $3x^2 - 12x + 1$  in the form:  $a(x - h)^2 + k$  we need to know the values of *a*, *h*, and *k* so that:

$$3x^{2} - 12x + 1 = a(x - h)^{2} + k$$
  
=  $a(x - h)(x - h) + k$   
=  $a(x^{2} - 2hx + h^{2}) + k$

So, how do we do that if these are written so differently? We can write the right-hand side like the left-hand side by • distributing After distributing on the right-hand side, we are left with:

$$3x^2 - 12x + 1 = ax^2 - 2ahx + ah^2 + k$$

We want these to be the same (equal) for every x. So, we need:

**3** = a  $-12 = -2ah = -2 \cdot 3h = -6h \rightarrow 2 = \frac{-12}{-6} = \frac{-6h}{-6} = h \rightarrow h = 2$  $1 = a \cdot h^2 + k = 3 \cdot 2^2 + k = 3 \cdot 4 + k = 12 + k$ 

To put  $3x^2 - 12x + 1$  in the form:  $a(x - h)^2 + k$  we need to know the values of *a*, *h*, and *k* so that:

$$3x^{2} - 12x + 1 = a(x - h)^{2} + k$$
  
=  $a(x - h)(x - h) + k$   
=  $a(x^{2} - 2hx + h^{2}) + k$   
=  $ax^{2} - 2ahx + ah^{2} + k$ 

So, how do we do that if these are written so differently? We can write the right-hand side like the left-hand side by • distributing After distributing on the right-hand side, we are left with:

$$3x^2 - 12x + 1 = ax^2 - 2ahx + ah^2 + k$$

We want these to be the same (equal) for every x. So, we need:

**3** = a  $-12 = -2ah = -2 \cdot 3h = -6h \rightarrow 2 = \frac{-12}{-6} = \frac{-6h}{-6} = h \rightarrow h = 2$  $1 = a \cdot h^2 + k = 3 \cdot 2^2 + k = 3 \cdot 4 + k = 12 + k \rightarrow 1 = 12 + k$ 

To put  $3x^2 - 12x + 1$  in the form:  $a(x - h)^2 + k$  we need to know the values of *a*, *h*, and *k* so that:

$$3x^{2} - 12x + 1 = a(x - h)^{2} + k$$
  
=  $a(x - h)(x - h) + k$   
=  $a(x^{2} - 2hx + h^{2}) + k$   
=  $ax^{2} - 2ahx + ah^{2} + k$ 

So, how do we do that if these are written so differently? We can write the right-hand side like the left-hand side by After distributing on the right-hand side, we are left with:

$$3x^2 - 12x + 1 = ax^2 - 2ahx + ah^2 + k$$

We want these to be the same (equal) for every x. So, we need:

**3** = a

 $-12 = -2ah = -2 \cdot 3h = -6h \rightarrow 2 = \frac{-12}{-6} = \frac{-6h}{-6} = h \rightarrow h = 2$  $1 = a \cdot h^2 + k = 3 \cdot 2^2 + k = 3 \cdot 4 + k = 12 + k \rightarrow 1 = 12 + k$  $\rightarrow k = 1 - 12$ 

To put  $3x^2 - 12x + 1$  in the form:  $a(x - h)^2 + k$  we need to know the values of *a*, *h*, and *k* so that:

$$3x^{2} - 12x + 1 = a(x - h)^{2} + k$$
  
=  $a(x - h)(x - h) + k$   
=  $a(x^{2} - 2hx + h^{2}) + k$   
=  $ax^{2} - 2ahx + ah^{2} + k$ 

So, how do we do that if these are written so differently? We can write the right-hand side like the left-hand side by After distributing on the right-hand side, we are left with:

$$3x^2 - 12x + 1 = ax^2 - 2ahx + ah^2 + k$$

We want these to be the same (equal) for every x. So, we need:

**3** = a

 $-12 = -2ah = -2 \cdot 3h = -6h \rightarrow 2 = \frac{-12}{-6} = \frac{-6h}{-6} = h \rightarrow h = 2$ 1 =  $a \cdot h^2 + k = 3 \cdot 2^2 + k = 3 \cdot 4 + k = 12 + k \rightarrow 1 = 12 + k$  $\rightarrow k = 1 - 12 = -11$ 

To put  $3x^2 - 12x + 1$  in the form:  $a(x - h)^2 + k$  we need to know the values of *a*, *h*, and *k* so that:

$$3x^{2} - 12x + 1 = a(x - h)^{2} + k$$
  
=  $a(x - h)(x - h) + k$   
=  $a(x^{2} - 2hx + h^{2}) + k$   
=  $ax^{2} - 2ahx + ah^{2} + k$ 

So, how do we do that if these are written so differently? We can write the right-hand side like the left-hand side by After distributing on the right-hand side, we are left with:

$$3x^2 - 12x + 1 = ax^2 - 2ahx + ah^2 + k$$

We want these to be the same (equal) for every x. So, we need:

**3** = a

$$-12 = -2ah = -2 \cdot 3h = -6h \rightarrow 2 = \frac{-12}{-6} = \frac{-6h}{-6} = h \rightarrow h = 2$$

 $1 = a \cdot h^{2} + k = 3 \cdot 2^{2} + k = 3 \cdot 4 + k = 12 + k \rightarrow 1 = 12 + k$  $\rightarrow \mathbf{k} = 1 - 12 = -\mathbf{11}$ 

**Conclusion:** We can re-write the polynomial in the form we want:

To put  $3x^2 - 12x + 1$  in the form:  $a(x - h)^2 + k$  we need to know the values of *a*, *h*, and *k* so that:

$$3x^{2} - 12x + 1 = a(x - h)^{2} + k$$
  
=  $a(x - h)(x - h) + k$   
=  $a(x^{2} - 2hx + h^{2}) + k$   
=  $ax^{2} - 2ahx + ah^{2} + k$ 

So, how do we do that if these are written so differently? We can write the right-hand side like the left-hand side by After distributing on the right-hand side, we are left with:
