

## Solving Linear Equations - Example

Find solutions to the equation:

$$2x + 4 = 3x + 12$$

## Solving Linear Equations - Example

Find solutions to the equation:

$$2x + 4 = 3x + 12$$

## Solving Linear Equations - Example

Find solutions to the equation:

$$2x + 4 = 3x + 12$$

Here,  $x$  shows up in the equation in more than one place.

To solve for  $x$ , we will start by getting the  $x$ 's together.

## Solving Linear Equations - Example

Find solutions to the equation:

$$2x + 4 = 3x + 12$$

Here,  $x$  shows up in the equation in more than one place.

To solve for  $x$ , we will start by getting the  $x$ 's together.

To remove  $x$  from the left side, we **Subtract  $2x$**  on both sides

## Solving Linear Equations - Example

Find solutions to the equation:

$$2x + 4 = 3x + 12$$

Here,  $x$  shows up in the equation in more than one place.

To solve for  $x$ , we will start by getting the  $x$ 's together.

To remove  $x$  from the left side, we **Subtract  $2x$**  on both sides

$$2x - 2x + 4 = 3x - 2x + 12$$

## Solving Linear Equations - Example

Find solutions to the equation:

$$2x + 4 = 3x + 12$$

Here,  $x$  shows up in the equation in more than one place.

To solve for  $x$ , we will start by getting the  $x$ 's together.

To remove  $x$  from the left side, we **Subtract  $2x$**  on both sides

$$4 = \cancel{2x} - \cancel{2x} + 4 = 3x - 2x + 12$$

## Solving Linear Equations - Example

Find solutions to the equation:

$$2x + 4 = 3x + 12$$

Here,  $x$  shows up in the equation in more than one place.

To solve for  $x$ , we will start by getting the  $x$ 's together.

To remove  $x$  from the left side, we **Subtract  $2x$**  on both sides

$$4 = \cancel{2x} - \cancel{2x} + 4 = \underbrace{3x - 2x}_x + 12 = x + 12$$

## Solving Linear Equations - Example

Find solutions to the equation:

$$2x + 4 = 3x + 12$$

Here,  $x$  shows up in the equation in more than one place.

To solve for  $x$ , we will start by getting the  $x$ 's together.

To remove  $x$  from the left side, we **Subtract  $2x$**  on both sides

$$4 = \cancel{2x} - \cancel{2x} + 4 = \underbrace{3x - 2x}_x + 12 = x + 12$$
$$4 = x + 12$$

## Solving Linear Equations - Example

Find solutions to the equation:

$$2x + 4 = 3x + 12$$

Here,  $x$  shows up in the equation in more than one place.

To solve for  $x$ , we will start by getting the  $x$ 's together.

To remove  $x$  from the left side, we **Subtract  $2x$**  on both sides

$$4 = \cancel{2x} - \cancel{2x} + 4 = \underbrace{3x - 2x}_x + 12 = x + 12$$
$$4 = x + 12$$

Now, we **Subtracting 12** to both sides

## Solving Linear Equations - Example

Find solutions to the equation:

$$2x + 4 = 3x + 12$$

Here,  $x$  shows up in the equation in more than one place.

To solve for  $x$ , we will start by getting the  $x$ 's together.

To remove  $x$  from the left side, we **Subtract  $2x$**  on both sides

$$4 = \cancel{2x} - \cancel{2x} + 4 = \underbrace{3x - 2x}_x + 12 = x + 12$$

$$4 = x + 12$$

Now, we **Subtracting 12** to both sides

$$4 - 12 = x + 12 - 12$$

## Solving Linear Equations - Example

Find solutions to the equation:

$$2x + 4 = 3x + 12$$

Here,  $x$  shows up in the equation in more than one place.

To solve for  $x$ , we will start by getting the  $x$ 's together.

To remove  $x$  from the left side, we **Subtract  $2x$**  on both sides

$$4 = \cancel{2x} - \cancel{2x} + 4 = \underbrace{3x - 2x}_x + 12 = x + 12$$
$$4 = x + 12$$

Now, we **Subtracting 12** to both sides

$$-8 = 4 - 12 = x + 12 - 12$$

## Solving Linear Equations - Example

Find solutions to the equation:

$$2x + 4 = 3x + 12$$

Here,  $x$  shows up in the equation in more than one place.

To solve for  $x$ , we will start by getting the  $x$ 's together.

To remove  $x$  from the left side, we **Subtract  $2x$**  on both sides

$$4 = \cancel{2x} - \cancel{2x} + 4 = \underbrace{3x - 2x}_x + 12 = x + 12$$

$$4 = x + 12$$

Now, we **Subtracting 12** to both sides

$$-8 = 4 - 12 = x + \cancel{12} - \cancel{12} = x$$

## Solving Linear Equations - Example

Find solutions to the equation:

$$2x + 4 = 3x + 12$$

Here,  $x$  shows up in the equation in more than one place.

To solve for  $x$ , we will start by getting the  $x$ 's together.

To remove  $x$  from the left side, we **Subtract  $2x$**  on both sides

$$4 = \cancel{2x} - \cancel{2x} + 4 = \underbrace{3x - 2x}_x + 12 = x + 12$$
$$4 = x + 12$$

Now, we **Subtracting 12** to both sides

$$-8 = 4 - 12 = \cancel{x + 12} - 12 = x$$

The solution to  $2x + 4 = 3x + 12$  is  $x = -8$
