We have seen in **Example 1** and **Example 2** how to solve systems of linear equations, which have the form:

Ax + By = CDx + Ey = F

We have seen in Example 1 and Example 2 how to solve systems
of linear equations, which have the form:

```
Ax + By = CDx + Ey = F
```

In order to solve the system, we need to solve one of the equations for one of the variables.

We have seen in **Example 1** and **Example 2** how to solve systems of linear equations, which have the form:

```
Ax + By = CDx + Ey = F
```

In order to solve the system, we need to solve one of the equations for one of the variables.

Note: This gives us four choices:

We have seen in **Example 1** and **Example 2** how to solve systems of linear equations, which have the form:

```
Ax + By = CDx + Ey = F
```

In order to solve the system, we need to solve one of the equations for one of the variables.

Note: This gives us four choices:

Solve the  $1^{st}$  equation for x, Solve the  $1^{st}$  equation for y Solve the  $2^{nd}$  equation for x, Solve the  $2^{nd}$  equation for y

We have seen in **Example 1** and **Example 2** how to solve systems of linear equations, which have the form:

```
Ax + By = CDx + Ey = F
```

In order to solve the system, we need to solve one of the equations for one of the variables.

Note: This gives us four choices:

Solve the  $1^{st}$  equation for x, Solve the  $1^{st}$  equation for ySolve the  $2^{nd}$  equation for x, Solve the  $2^{nd}$  equation for yIt is important to know that you can use any of these to solve any system, but sometimes to algebra and arithmetic are easier in some cases more than others.

We have seen in **Example 1** and **Example 2** how to solve systems of linear equations, which have the form:

```
Ax + By = CDx + Ey = F
```

In order to solve the system, we need to solve one of the equations for one of the variables.

Note: This gives us four choices:

Solve the  $1^{st}$  equation for x, Solve the  $1^{st}$  equation for ySolve the  $2^{nd}$  equation for x, Solve the  $2^{nd}$  equation for yIt is important to know that you can use any of these to solve any system, but sometimes to algebra and arithmetic are easier in some cases more than others.

Once we have solved one equation for one variable, we substitute the solved variable into the other equation.

We have seen in **Example 1** and **Example 2** how to solve systems of linear equations, which have the form:

```
Ax + By = CDx + Ey = F
```

In order to solve the system, we need to solve one of the equations for one of the variables.

Note: This gives us four choices:

Solve the  $1^{st}$  equation for x, Solve the  $1^{st}$  equation for ySolve the  $2^{nd}$  equation for x, Solve the  $2^{nd}$  equation for yIt is important to know that you can use any of these to solve any system, but sometimes to algebra and arithmetic are easier in some cases more than others.

Once we have solved one equation for one variable, we substitute the solved variable into the other equation.

Doing this will give us an equation with just one variable, which we learned how to solve at the beginning of the course.

We have seen in **Example 1** and **Example 2** how to solve systems of linear equations, which have the form:

```
Ax + By = CDx + Ey = F
```

In order to solve the system, we need to solve one of the equations for one of the variables.

Note: This gives us four choices:

Solve the  $1^{st}$  equation for x, Solve the  $1^{st}$  equation for ySolve the  $2^{nd}$  equation for x, Solve the  $2^{nd}$  equation for yIt is important to know that you can use any of these to solve any system, but sometimes to algebra and arithmetic are easier in some cases more than others.

Once we have solved one equation for one variable, we substitute the solved variable into the other equation.

Doing this will give us an equation with just one variable, which we learned how to solve at the beginning of the course. Once we solve for one variable, we can substitute it in any of our equations with 2 variables to solve for the other.
